ABSTRACT

Working capital management involves the management of the most liquid resources of the firm which includes cash and cash equivalents, inventories, trade debtors, and other receivables. Most budding entrepreneurs do not ensure an optimal level of working capital and this has been a major obstacle to their overall profitability. The study examined the factors affecting working capital management practices of budding entrepreneurs in Miri, Sarawak. In this research study, the researcher mainly focuses on the four factors which are cash conversion, inventory turnover, accounts receivable, and accounts payable. The quantitative Technique method is used to examine the relationship between independent variables and dependent variables. The four independent variables showed a significant relationship of working capital management's effects on budding entrepreneurs. This research was concluded with the discussion of findings, implications of the study, limitations of the study, and recommendations for future research.
