ABSTRACT

According to Jomo (2017), Malaysia is aging population, by 2035 citizens over 65 years old represent 15% of the population. At present, most Malaysians' EPF savings are hardly enough for them to live a decent life after retirement. It is important to understand the perception of university and college students in Miri on retirement planning in Malaysia. Thus, the research attempts to identify the relationship between certain variables and retirement planning among youths in Miri. Independent variable utilized in this study includes financial literacy, saving behaviour, income level and education level. The research methodology will use quantitative research. Primary data will be collect by using Google form. The data will be collect and analyse by using simple statistic method. The research will be done through distributing 80 questionnaires to university and college students in Miri. Data collected from the survey were analyzed using Microsoft Excel.
