ABSTRACT

This research is to investigate the Security Awareness of Online Banking users among college students in Miri. This is to show how the college students are aware of the security while they are using the online banking systems. If they do not understand the security of the online banking systems, they might ended up being fraud and stolen of their property. The researcher has limited to the sample, population, location, research questions and research topic will be conducted. 50 questionnaires will be distriuted to college students in IBS miri randomly by the researcher and last but not least, this research study will be complete in within six months.

Based on this chapter is to study how demographic variables such as age, gender, and education affect the security awareness of college students in Miri. This chapter consists of type of research, process of data collection, research instrument and type of analysis. This research was using qualitative questionnaire. The questionnaire were distributed to 50 college students in Miri randomly as the primary data and secondary data are taken from the journal paper, relevant book and internet. The questionnaire results were sorted into Section A, B, C and D. Section A is

about the background of the users in Miri, whereas section B, C, and D is focused into the research questions.

This research finding shows that 50% of the college students uses online banking and 50% of the college students does not use the online banking because they are not interested inside the online banking.

The recommendation are the college students should be more aware of their security while they are using the online banking and they should be more aware while they are using the online banking systems.
